

Overview of the Zoogeographical Distribution of Aquatic and Semi-Aquatic Heteroptera (Hemiptera) in Turkey

Gülten Yazıcı*

Directorate of Plant Protection Central Research Institute, 06172 Yenimahalle, Ankara, Turkey.

ABSTRACT. The aim of this study is to review the faunistic and systematic studies on aquatic and semi-aquatic Heteroptera of Turkey and to make an analysis on the distribution and zoogeographically of the Turkish fauna. In this study, one species of Enicocephalomorpha, one species of Dipsocoromorpha, 51 species in 13 genera of Gerromorpha, four species in three genera of Leptopodomorpha and 55 species in 19 genera of Nepomorpha are reviewed. In total, 112 species belonging to 37 genera of five Infraorders are discussed from Turkey. Besides, all specimens were collected between 2009 and 2018 by the author and the specimens deposited in the Nazife Tuatay Plant Protection Museum (Ankara) were also included in. It was determined that 94 species are distributed from Mediterranean, 57 species from Europe-Siberia and 90 species from Irano-Turanian. It was determined that nine species and subspecies comprising 8% of Turkish aquatic and semi-aquatic Heteroptera are endemic are located in Turkey. In addition, new locality records are given for the species that have been collected and diagnosed. Species composition, diversity and proportion of endemism varies considerably among the zoogeographic regions of the country.

Introduction

Turkey is divided into three zoographical zones which were allocated according to their climate, flora and fauna, location, agricultural diversities, topography, human habitat, transportation et al., First region is called the Mediterranean along the seaside in the Mediterranean Region, the Marmara Region and the Aegean Region. Second region is named the Euro-Siberian along coast of the Black Sea. The other region is named Irano-Turanian according to their location in Anatolia (Central, Eastern and Southeastern Anatolia Regions). The Anatolian diagonal, which has been recognised as a biogeographic boundary between the central and eastern Anatolian flora and fauna is one of the most distinctive biogeographic features that helps in understanding the biodiversity of Anatolia (Gür, 2016). The topographical and climatic structure gives the opportunity to host a rich and varied fauna to the Turkey (Fig. 1).

Turkey would occupy Asia Minor (Anatolia) between the Black Sea and the Mediterranean Sea and extends up to the European continent. It has a rich fauna of Aquatic and Semi-Aquatic Heteroptera. Thus, some faunistic and systematic studies have been carried by both foreign and native researchers in Turkey. However, there are no studies to determine the distribution and biogeography of Aquatic and Semi-Aquatic Heteroptera in Turkey. Yet, make such a study in the West Palearctic region is very important for researchers working in this field.

In this study, the publications on the aquatic and semi-aquatic Heteroptera in Turkey are reviewed (Banbal & Fent, 2016; Dursun, 2011, 2012, 2017; Fent et al., 2011; Hoberlandt, 1948, 1952, 1956; Kiyak et al., 2004a, 2004b, 2007, 2008; Kment & Jindra, 2005; Küçükbaşmacı & Kiyak, 2015; Önder & Adıgüzel, 1979; Önder et al., 1981, 1984, 2006; Salur & Mesci, 2009; Seidenstücker, 1957, 1959; Topkara et al., 2010, 2011; Topkara, 2013; Topkara & Ustaoglu, 2014, 2015; Wagner, 1966, 1976; Yıldırım et al., 2013) and their zoogeographical distribution are analyzed and discussed.

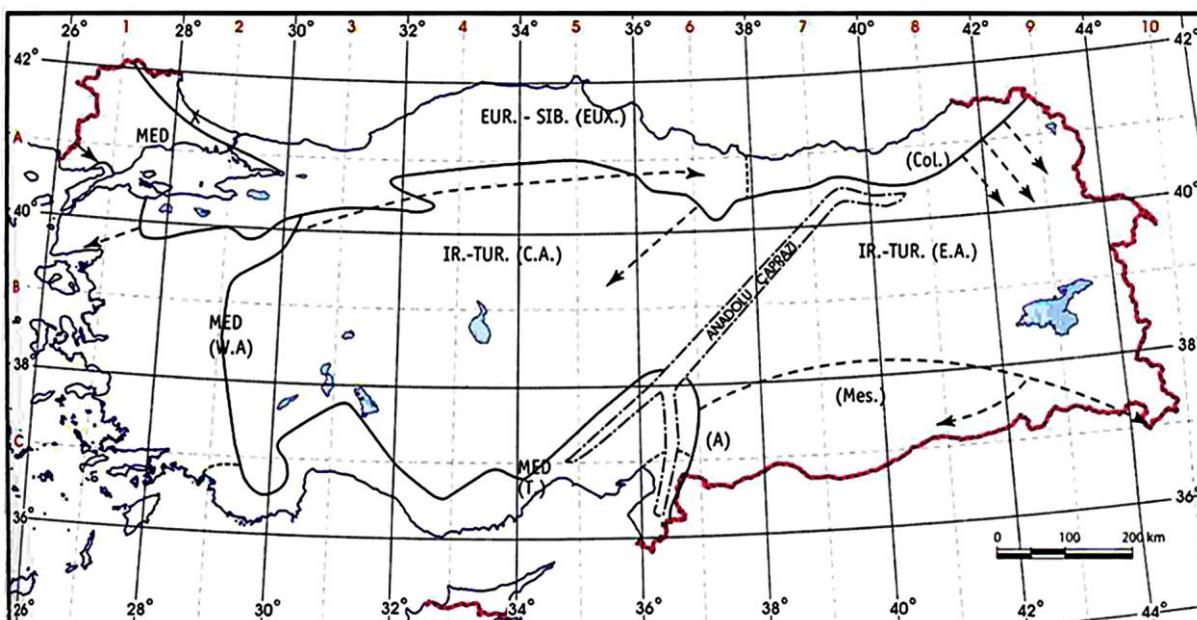

Figure 1. The map of Turkey's zoographical regions (Çokçalışkan, 2014).

Material and methods

The study material were constituted from specimens collected between 2009 and 2018 by the authers and the specimens deposited in the Nazife Tuatay Plant Protection Museum (Ankara) were also included in. In this article, the previous publications on the aquatic and semi-aquatic Heteroptera of Turkey are reviewed and the distribution and zoogeography of the Turkish fauna are examined. In the article, the species whose type localities are in Turkey are pick up with an asterisk (*), and the endemic species are given in this way. Faunal similarities between zoographical regions of Turkey were assessed, without regard to differences in region area by using Jaccard coefficient of similarity (see Legendre & Legendre, 1998). The similarity matrix resulting from pair-wise calculations was then subjected to unweighted arithmetic average clustering (Biodiv Pro2. program).

Results

One species of Enicocephalidae, one species of Dipsocoromorpha, two species in one genera of Mesoveliidae, four species in one genus of Hebridae, two species in one genus of Hydrometridae, 13 species in three genera of Veliidae, 14 species in three genera of Gerridae, 16 species in four genera of Saldidae, four species in three genera of Leptopodidae, two species in two genera of Nepidae, one species of Belostomatidae, one species of Ochteridae, 35 species in nine genera of Corixidae, two species in two genera of Naucoridae, two species in one genus of Aphelocheiidae, 10 species in two genera of Notonectidae and two species in one genus of Pleidae were reviewed. In total, 112 species of 37 genera belonging to 17 families of aquatic and semi-aquatic Heteroptera are recorded from Turkey (Table 1). Among them, ten species (8%) of aquatic and semi-aquatic Heteroptera are endemic (Table 1). Furthermore, the type localities of seven species (*Micronecta wui alkani* Hoberlandt, *Sigara kervillei* (Poisson), *Sigara samani samani* Hoberlandt, *Notonecta glauca kervillei* Poisson, *Notonecta glauca poissoni* Hungerford, *Microvelia hozari* Hoberlandt, *Velia mariae* Tamanini) are situated in Turkey.

It was determined that there are big differences in terms of species composition and richness between the zoogeographic regions in Turkey (Table 1, Fig. 2). It was determined that 94 (84%) species are distributed from Mediterranean, 57 (51%) species from Europe-Siberian, and 90 (80%) species from Irano-Turanian. While 48 species distribute in all regions, only 31 species distribute in one region. The genera and species diversity is highest in the Mediterranean followed by Irano-Turanian regions. The cluster analysis of faunal similarities on Aquatic and Semi-Aquatic Heteroptera among three zoographical regions of Turkey produce two major clusters (Fig. 3): Mediterranean and Irano-Turanian (bootstrap probability 83.81%) which form united cluster (bootstrap 68.45%). This coupled largest cluster belongs to Eastern Mediterranean in the Palaearctic. Second cluster (EUR.-SIB.) show minimum similarity (68%) with other Turkish fauna. Euro-Siberian indicate least similarity (68%) with other Turkish fauna and belongs to Siberian region in the Palaearctic. Mediterranean and Irano-Turanian fauna have highest similarity (84%) and contains most of the Aquatic and Semi-Aquatic Heteroptera species in Turkey. The ordination of the three zoogeographical regions of Turkey in the diminished field of the first two principal coordinates for 113 species of Aquatic and Semi-Aquatic Heteroptera see Fig. 4.

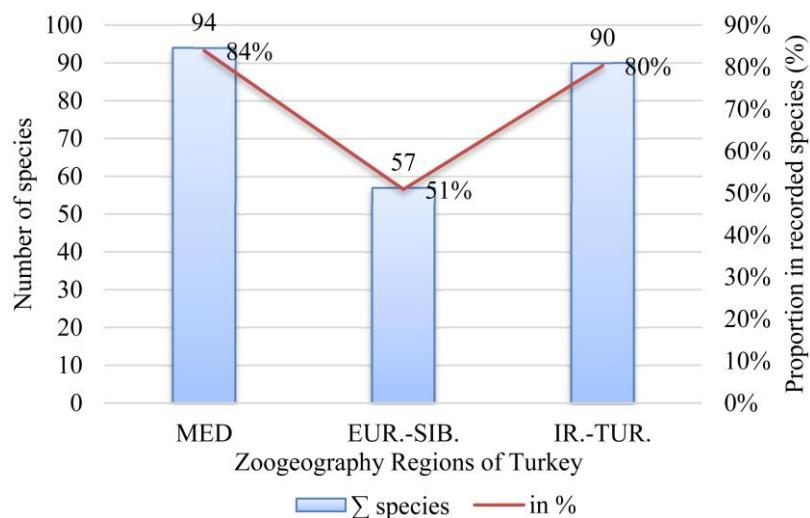

Figure 2. Number of species of aquatic and semi-aquatic Heteroptera in the zoogeographical regions of Turkey. **MED:** Mediterranean, **EUR.-SIB.:** Euro-Siberian, **IR.-TUR.:** Irano-Turanian.

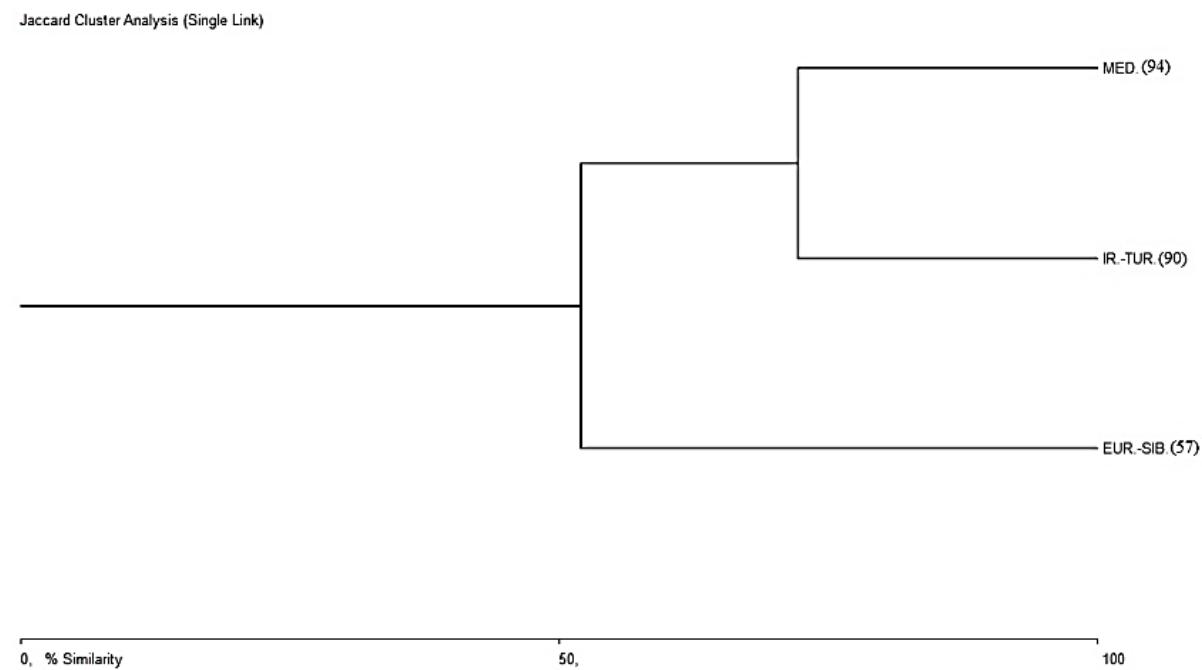

Figure 3. Similarity of 112 species of Aquatic and Semi-Aquatic Heteroptera from three zoogeographical regions of Turkey (Dice, $r = 0.66$) (Number of the species is shown in the parentheses next to the names of regions).

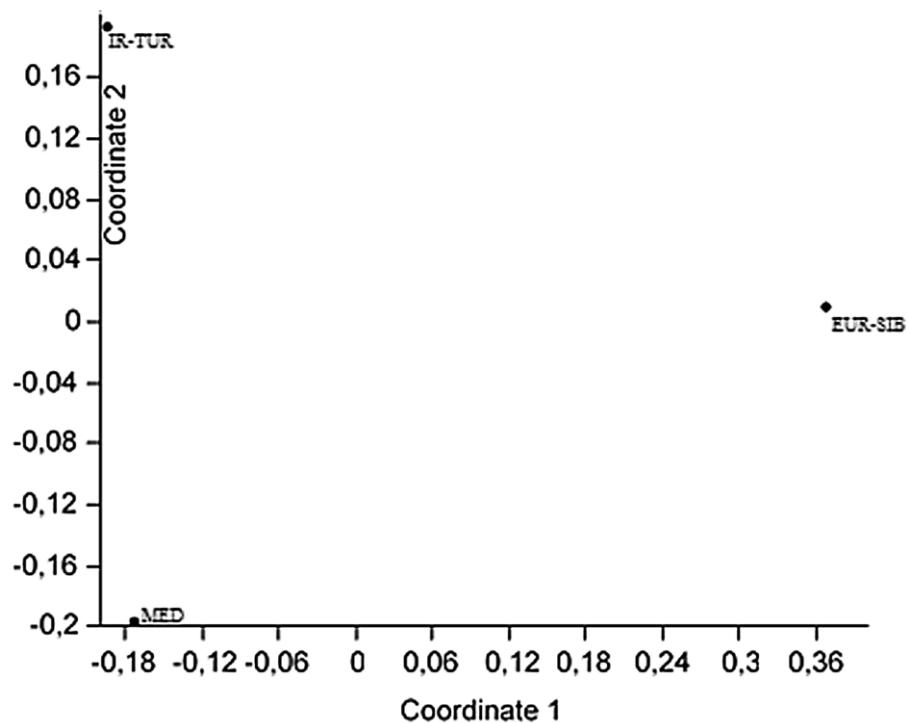

Figure 4. Ordination of the three zoogeographical regions in the diminished field of the first two principal coordinates for 125 species of Aquatic and Semi-Aquatic Heteroptera (Dice, $r = 0.66$). For names of regions see [Figure 3](#).

17 Family	37 Genus and 112 Species	57	90	94	

MED: Mediterranean, EUR.-SIB.: Euro-Siberian, IR.-TUR.: Irano-Turanian, *:endemic, **:restricted distribution.

Discussion

In this study, 112 species of 37 genera belonging to 17 families (Enicocephalidae, Dipsocoridae, Mesoveliidae, Hebridae, Hydrometridae, Veliidae, Gerridae, Saldidae, Leptopodidae, Nepidae, Belostomatidae, Ochteridae, Corixidae, Naucoridae, Aphelocheiridae, Notonectidae, Pleidae) of aquatic and semi-aquatic Heteroptera were recorded from Turkey. Among them, ten species (8%) are endemic. Additionally, the most widespread species in all zoogeographic regions are ([Table 1](#)): *Aquarius paludum paludum* (Fabricius), *Hydrometra stagnorum* (Linnaeus), *Gerris argentatus* Schummel, *G. lacustris* (Linnaeus), *G. maculatus* Tamanini, *G. thoracicus* Schummel, *Saldula arenicola arenicola* (Scholtz), *Notonecta meridionalis* Poisson, *N. viridis* Delcourt, *Corixa affinis* Leach, *C. panzeri* Fieber, *C. punctata* (Illiger), *Hesperocorixa linnaei* (Fieber), *Paracorixa concinna concinna* (Fieber), *Sigara nigrolineata nigrolineata* (Fieber), *S. lateralis* (Leach), *S. striata* (Linnaeus).

In addition, new locality records are given for *Aquarius najas* (De Geer), *A. paludum paludum* (Fabricius), *Gerris gibbifer* (Schummel), *G. lacustris* (Linnaeus), *G. maculatus* Tamanini, *Saldula amplicollis* (Reuter), *S. arenicola arenicola* (Scholtz), *Salda littoralis* (Linnaeus), *Lethocerus patruelis* (Stål), *Corixa punctata* (Illiger), *S. nigrolineata nigrolineata* (Fieber), *S. lateralis* (Leach), *Notonecta marmorea* Fabricius, 1803 that have been collected and diagnosed. New locality records are shown on ([Fig. 5](#)). Two species *Saldula arenicola arenicola* (Scholtz) and *Salda littoralis* (Linnaeus) are given as the new distributional record for Irano-Turanian region.

There are big differences in terms of endemic species composition abundance among the zoogeographic regions of Turkey. Accordingly, five species were determined from Irano-Turanian, eight species from Mediterranean and one species from Euro-Siberian. As a result, the zoogeographic region with the highest endemism is Mediterranean ([Table 1](#)). While Gerridae species are distributed in almost every region, *Gerris caucasicus* is only distributed in Irano-Turanian region. *G. caucasicus* Kanyukova which is determined from Iran-Turkey region, is recorded from Amasya, Çorum, Sivas, Tokat and Van ([Aukema & Rieger, 1995](#); [Önder et al., 2006](#); [Fent et al., 2011](#); [Dursun, 2012, 2017](#)). Also it is distributed in Russia, Azerbaijan, Armenia, Georgia and Iran in the Palaearctic region ([Aukema & Rieger, 1995](#)). [Linnauori \(1994\)](#) recorded *Gerris kiristhenkoi* Kanyukova from Iraq. However, it is quite clear that is a misidentification, most likely of *G. caucasicus* Kanyukova ([Aukema & Rieger, 1995](#)). When the distribution area of the species is examined, it is determined that Turkey is the most western border. *Gerris kabaishanus* Linnauori was reported from Kilis by [Fent et al. \(2011\)](#) who noted that this species was recorded as *G. lacustris* P. Kment from Kilis by [Hoberlandt \(1952\)](#). Also in the same literature, it is given as *G. lacustris* from northern Iraq by [Jaczewski \(1964\)](#). Thus it could not change from Mediterranean (from the Toros mountains) to other regions and the species belonging to Mesopotamia and has endemic status.

Saldula lindbergi Lindskog was recorded from Antalya (part of the Toros mountains of the Mediterraen region) by [Hoberlandt \(1952\)](#) and [Fent et al. \(2011\)](#). This species is distributed in Asian part of the Turkey and Cyprus ([Aukema & Rieger, 1995](#)). Therefore, the northern boundary within the distribution area constitutes Turkey. It may be the species has restricted distribution in eastern Mediterranean. Also *Saldula saltatoria* (Linnaeus) has been reported for the first time from the study area (it collected from Ankara, Erzurum and Van province of the Irano-Turanian) in Turkey.

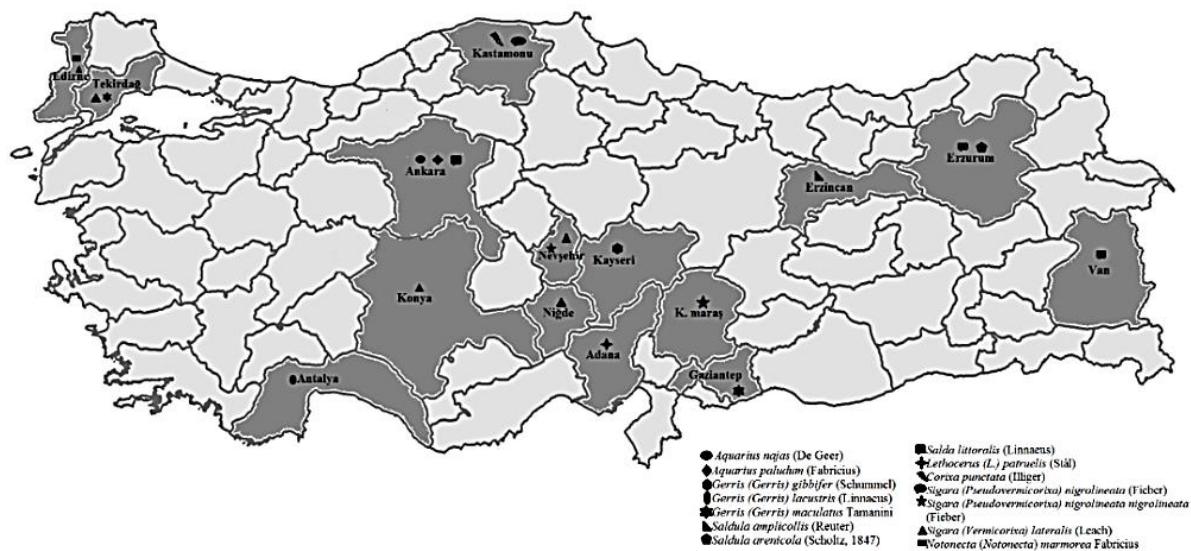

Figure 5. New locality records for species of aquatic and semi-aquatic Heteroptera

Monticorixa armeniaca (Štys) was reported from Mersin (part of the Toros mountains of the Mediterraen region) by Önder et al. (2006). Also it distributes n in Armenia and Georgia (Aukema & Rieger, 1995). Aukema & Rieger (1995) reported that it was given as *Arctocoris armeniaca* by Jansson (1986). Besides this species it was reported distribution from Ardahan (part of the part of the Eastern Anatolia of the Irano-Turanian) by Fent et al. (2011). Hence, this species may be Siberian species. *Callicorixa raddei* (Kiritshenko & Jaczewski) was reported from Ağrı, Ardahan, Erzurum, Kars, Van (part of the Eastern Anatolia of the Irano-Turanian) by Önder et al. (2006), Dursun (2011) and Fent et al. (2011). Aukema & Rieger (1995) gave distribution from Armenian and Georgia. So this species is Siberian species and the western border of the distribution area is Turkey. *Notonecta marmorea* Fabricius has been reported for the first time from the study area (it collected from Edirne province of the Mediterranean region) in Turkey.

Sigara iranica Lindberg was reported from Ardahan and Van (part of the Eastern Anatolia of the Irano-Turanian) by Fent et al. (2011). General distribution is in Iran (Aukema & Rieger, 1995; Fent et al., 2011). It may not have passed to the west of the Anatolian cross. Endemism or restricted distribution may be occurred. Therefore, it needs to be investigated in more detail. *Sigara daghestanica* Jansson was reported from Konya (part of the Central Anatolia of the Irano-Turanian) by Önder et al. (2006). This species is distributed in Armenia, Azerbaijan, Iran, Russia (Aukema & Riger, 1995; Fent et al., 2011). The western border of the distribution area is Turkey. It can be said that the species has a restricted distribution. *Sigara samani samani* Hoberlandt was reported from Adana, Mersin (part of the Toros of the Mediterraen) by Seidenstücker (1959), Önder et al. (2006) and Fent et al. (2011). This species has been reported from Syria, Lebanon and Israel (Aukema & Rieger, 1995; Fent et al., 2011; Önder et al., 2006). The northern border of the distribution area is Turkey and it is an endemic species. *Sigara samani tigranes* Jansson was given from Diyarbakır and Mardin by Fent et al. (2011) and Önder et al. (2006). The species was reported from Syria, Iran, Iraq (Aukema & Rieger, 1995). Therefore, it can be evaluated that it is a Mesopotamian endemic species. *Sigara stagnalis stagnalis* (Leach) was reported from İzmir as new record for the Turkey fauna by Topkara et al. (2010). Also species is widely

distributed in Algeria, Belgium, Cyprus, Denmark, France, Great Britain, Germany, Ireland, Italy, Morocco, the Netherlands, Poland, Spain and Sweden (Aukema & Rieger, 1995). When the distribution area of the species is examined, it is determined that Turkey is the most eastern border. Concerning the distribution it seems to be a Mediterranean species.

Aquatic and semi-aquatic Heteroptera fauna in Turkey can be considered as very species rich group. Turkey is a country located as a bridge between Europe and Asia. It has different climatic conditions. Both geographic position and climatic differentiations have some effects on flora and fauna. Because of this, Turkey has been focused by Turkish and foreign scientists for a long period. The highest number of species are known from the zoogeographical regions of Turkey. Turkish aquatic and semi-aquatic Heteroptera fauna is very rich. The great richness and diversity of aquatic and semi-aquatic Heteroptera fauna in Turkey is one result of the variety topographic and climatic structure of the country.

Acknowledgments

I am grateful to Dr. Yasemin Güler (Turkey) and Didem Coral Şahin (Turkey) for providing English language control.

Conflict of Interests

The author declares that there is no conflict of interest regarding the publication of this paper.

 تاریخ دریافت: ۵ آذر ۱۳۹۸ ، تاریخ پذیرش: ۱۵ اسفند ۱۳۹۸ ، تاریخ انتشار: ۲۴ اسفند ۱۳۹۸

چکیده: هدف از این تحقیق، مرور مطالعات فونستیک و سیستماتیک ناجوربالان آبزی و نیمه آبزی ترکیه و تحلیل پراکنش و جغرافیایی جانوری فون ترکیه در این گروه است. در این مطالعه یک گونه از Enicocephalomorpha، یک گونه از Dipsocoromorpha متعلق به سه جنس از Leptopodomorpha و ۵۵ گونه متعلق به ۱۹ جنس از Nepomorpha و در مجموع، ۱۱۲ گونه متعلق به ۳۷ جنس از ۵ مادون راسته از ترکیه بررسی شد. تمام نمونه‌های جمع‌آوری شده توسط نویسنده از سال ۲۰۰۹ تا ۲۰۱۸ و نمونه‌های ذخیره شده در موزه گیاهپزشکی Nazife Tuatay (آنکارا) نیز بررسی شدند. بر اساس تحلیل صورت گرفته، مشخص شد ۹۴ گونه در منطقه مدیترانه‌ای، ۵۷ گونه از بخش اروپا-سیبری و ۹۰ گونه از منطقه ایرانی - تورانی پراکنش دارند. در این بین، ۹ گونه و زیرگونه شامل ۸ درصد سن‌های آبزی و نیمه آبزی بومی ترکیه هستند. همچنین، گزارش‌هایی محلی جدید برای گونه‌های جمع‌آوری شده ثبت شد. بر اساس نتایج بدست آمده، ترکیب و تنوع گونه‌ای، و نسبت گونه‌های بومی در بین مناطق مختلف جغرافیایی جانوری ترکیه بسیار متفاوت است.

واژگان کلیدی: ناجوربالان، جغرافیایی جانوری، منطقه پالئارکتیک، تنوع گونه‌ای
